1. *Abstract* The purpose of this study was to investigate the effect of a 12-week training program on the physical and psychological health of elderly people. The study was conducted in a community center in a city in the north of Iran. The participants were 30 elderly people (15 men and 15 women) aged 65 and over. They were divided into two groups: a control group and an experimental group. The experimental group participated in a 12-week training program consisting of aerobic exercises, strength training, and flexibility exercises. The control group did not participate in any training program. The data were collected at the beginning and at the end of the 12-week period. The results showed that the experimental group had significant improvements in physical health (e.g., increased muscle strength, improved balance, and increased endurance) and psychological health (e.g., reduced anxiety and depression, and improved mood) compared to the control group. The findings suggest that a 12-week training program can be an effective intervention for improving the physical and psychological health of elderly people.
